

**AMENDMENTS TO THE CLAIMS**

**This listing of claims will replace all prior versions and listings of claims in the application:**

**LISTING OF CLAIMS:**

Claim 1 (currently amended): A mobile communications terminal comprising:

a voice pattern/ telephone directory registration means in which telephone directories, each of which includes various types of data to be used for starting communication with a target of communication, are registered and voice patterns corresponding to the telephone directories are registered;

a voice input means for receiving voice of a user designating a target of communication and thereby outputting a voice signal;

a ~~voice~~-speech recognition means for analyzing and recognizing the voice signal outputted by the voice input means and thereby obtaining voice data, comparing the obtained voice data with the voice patterns that have been registered in the voice pattern/ telephone directory registration means, and thereby searching for and retrieving a voice pattern that matches or nearly matches the obtained voice data; and

a memory search processing means for calling up a telephone directory that has been registered in the voice pattern/ telephone directory registration means corresponding to the voice pattern retrieved by the ~~voice~~-speech recognition means.

Claim 2 (original): A mobile communications terminal as claimed in claim 1, wherein the telephone directory at least includes a telephone number, a mail address and a URL (Uniform Resource Locator).

Claim 3 (original): A mobile communications terminal as claimed in claim 1, further comprising a data type designation means for letting the user designate the type of data to be called up from the various types of data of the telephone directory.

Claim 4 (original): A mobile communications terminal as claimed in claim 1, wherein the memory search processing means automatically designates the type of data to be called up from the various types of data of the telephone directory based on application activation status of the mobile communications terminal.

Claim 5 (original): A mobile communications terminal as claimed in claim 1, further comprising a display means for displaying data of the telephone directory called up by the memory search processing means.

Claim 6 (original): A mobile communications terminal as claimed in claim 1, further comprising a communication starting means for automatically starting communication with the target designated by the user by use of data of the telephone directory called up by the memory search processing means.

Claim 7 (currently amended): A mobile communications terminal comprising:

a voice pattern/ data registration means in which various types of data to be used for starting communication with targets of communication are registered and voice patterns corresponding to each data are registered with regard to each data type independently;

a data type designation means for designating the type of data to be called up;

a voice input means for receiving voice of a user designating a target of communication and thereby outputting a voice signal;

a ~~voice~~-speech recognition means for analyzing and recognizing the voice signal outputted by the voice input means and thereby obtaining voice data, comparing the obtained voice data with voice patterns that have been registered in the voice pattern/ data registration means with regard to the data type designated by the data type designation means, and thereby searching for and retrieving a voice pattern that matches or nearly matches the obtained voice data; and

a memory search processing means for calling up data of the type designated by the data type designation means that has been registered in the voice pattern/ data registration means corresponding to the voice pattern retrieved by the ~~voice~~speech recognition means.

Claim 8 (original): A mobile communications terminal as claimed in claim 7, wherein the various types of data at least includes a telephone number, a mail address and a URL (Uniform Resource Locator).

Claim 9 (original): A mobile communications terminal as claimed in claim 7, wherein the data type designation means lets the user designate the type of data to be called up.

Claim 10 (original): A mobile communications terminal as claimed in claim 7, wherein the data type designation means automatically designates the type of data to be called up based on application activation status of the mobile communications terminal.

Claim 11 (original): A mobile communications terminal as claimed in claim 7, further comprising a display means for displaying the data called up by the memory search processing means.

Claim 12 (original): A mobile communications terminal as claimed in claim 7, further comprising a communication starting means for automatically starting communication with the target designated by the user by use of the data called up by the memory search processing means.

Claim 13 (currently amended): A ~~voice~~speech recognition method for a mobile communications terminal, comprising the steps of:

a voice pattern/ telephone directory registration step in which telephone directories, each of which includes various types of data to be used for starting communication with a target of communication, are registered and voice patterns corresponding to the telephone directories are registered;

a voice input step in which voice of a user designating a target of communication is received and thereby a voice signal is generated;

a ~~voice~~speech recognition step in which the voice signal generated in the voice input step is analyzed and recognized and thereby voice data is obtained, the obtained voice data is compared with the voice patterns that have been registered in the voice pattern/ telephone directory registration step, and thereby a voice pattern that matches or nearly matches the obtained voice data is searched for and retrieved; and

a memory search step in which a telephone directory that has been registered in the voice pattern/ telephone directory registration step corresponding to the voice pattern retrieved in the ~~voice~~speech recognition step is called up.

Claim 14 (currently amended): A ~~voice~~speech recognition method for a mobile communications terminal as claimed in claim 13, wherein the telephone directory at least includes a telephone number, a mail address and a URL (Uniform Resource Locator).

Claim 15 (currently amended): A ~~voice~~speech recognition method for a mobile communications terminal as claimed in claim 13, further comprising a data type designation step in which the type of data to be called up from the various types of data of the telephone directory is designated by the user.

Claim 16 (currently amended): A ~~voice~~speech recognition method for a mobile communications terminal as claimed in claim 13, wherein in the memory search step, the type of data to be called up from the various types of data of the telephone directory is automatically designated based on application activation status of the mobile communications terminal.

Claim 17 (currently amended): A ~~voice~~speech recognition method for a mobile communications terminal as claimed in claim 13, further comprising a display step in which data of the telephone directory called up in the memory search step is displayed.

Claim 18 (currently amended): A ~~voice~~speech recognition method for a mobile communications terminal as claimed in claim 13, further comprising a communication starting step in which communication with the target designated by the user is automatically started by use of data of the telephone directory called up in the memory search step.

Claim 19 (currently amended): A ~~voice~~speech recognition method for a mobile communications terminal, comprising the steps of:

a voice pattern/ data registration step in which various types of data to be used for starting communication with targets of communication are registered and voice patterns corresponding to each data are registered with regard to each data type independently;

a data type designation step in which the type of data to be called up is designated;

a voice input step in which voice of a user designating a target of communication is received and thereby a voice signal is generated;

a ~~voice~~-speech recognition step in which the voice signal generated in the voice input step is analyzed and recognized and thereby voice data is obtained, the obtained voice data is compared with voice patterns that have been registered in the voice pattern/ data registration step with regard to the data type designated in the data type designation step, and thereby a voice pattern that matches or nearly matches the obtained voice data is searched for and retrieved; and

a memory search step in which data of the type designated in the data type designation step that has been registered in the voice pattern/ data registration step corresponding to the voice pattern retrieved in the ~~voice~~-speech recognition step is called up.

Claim 20 (currently amended): A ~~voice~~-speech recognition method for a mobile communications terminal as claimed in claim 19, wherein the various types of data at least includes a telephone number, a mail address and a URL (Uniform Resource Locator).

Claim 21 (currently amended): A ~~voice~~-speech recognition method for a mobile communications terminal as claimed in claim 19, wherein the type of data to be called up is designated by the user in the data type designation step.

Claim 22 (currently amended): A ~~voice~~speech recognition method for a mobile communications terminal as claimed in claim 19, wherein the type of data to be called up is automatically designated based on application activation status of the mobile communications terminal in the data type designation step.

Claim 23 (currently amended): A ~~voice~~speech recognition method for a mobile communications terminal as claimed in claim 19, further comprising a display step in which the data called up in the memory search step is displayed.

Claim 24 (currently amended): A ~~voice~~speech recognition method for a mobile communications terminal as claimed in claim 19, further comprising a communication starting step in which communication with the target designated by the user is automatically started by use of the data called up in the memory search step.

Claim 25 (currently amended): A machine-readable record medium storing a program for instructing a computer, an MPU (MicroProcessor Unit), etc. of a mobile communications terminal to execute a ~~voice~~speech recognition process, wherein the ~~voice~~speech recognition process comprises the steps of:

a voice pattern/ telephone directory registration step in which telephone directories, each of which includes various types of data to be used for starting communication with a target of communication, are registered and voice patterns corresponding to the telephone directories are registered;

a voice input step in which voice of a user designating a target of communication is received and thereby a voice signal is generated;

a ~~voice~~-speech recognition step in which the voice signal generated in the voice input step is analyzed and recognized and thereby voice data is obtained, the obtained voice data is compared with the voice patterns that have been registered in the voice pattern/ telephone directory registration step, and thereby a voice pattern that matches or nearly matches the obtained voice data is searched for and retrieved; and

a memory search step in which a telephone directory that has been registered in the voice pattern/ telephone directory registration step corresponding to the voice pattern retrieved in the ~~voice~~-speech recognition step is called up.

Claim 26 (original): A machine-readable record medium as claimed in claim 25, wherein the telephone directory at least includes a telephone number, a mail address and a URL (Uniform Resource Locator).

Claim 27 (currently amended): A machine-readable record medium as claimed in claim 25, wherein the ~~voice~~-speech recognition process further comprises a data type designation step in which the type of data to be called up from the various types of data of the telephone directory is designated by the user.

Claim 28 (original): A machine-readable record medium as claimed in claim 25, wherein in the memory search step, the type of data to be called up from the various types of data of the telephone directory is automatically designated based on application activation status of the mobile communications terminal.

Claim 29 (currently amended): A machine-readable record medium as claimed in claim 25, wherein the ~~voice~~-speech recognition process further comprises a display step in which data of the telephone directory called up in the memory search step is displayed.

Claim 30 (currently amended): A machine-readable record medium as claimed in claim 25, wherein the ~~voice~~-speech recognition process further comprises a communication starting step in which communication with the target designated by the user is automatically started by use of data of the telephone directory called up in the memory search step.

Claim 31 (currently amended): A machine-readable record medium storing a program for instructing a computer, an MPU (MicroProcessor Unit), etc. of a mobile communications terminal to execute a ~~voice~~speech recognition process, wherein the voice recognition process comprises the steps of:

a voice pattern/ data registration step in which various types of data to be used for starting communication with targets of communication are registered and voice patterns corresponding to each data are registered with regard to each data type independently;

a data type designation step in which the type of data to be called up is designated;

a voice input step in which voice of a user designating a target of communication is received and thereby a voice signal is generated;

a ~~voice~~speech recognition step in which the voice signal generated in the voice input step is analyzed and recognized and thereby voice data is obtained, the obtained voice data is compared with voice patterns that have been registered in the voice pattern/ data registration step with regard to the data type designated in the data type designation step, and thereby a voice pattern that matches or nearly matches the obtained voice data is searched for and retrieved; and

a memory search step in which data of the type designated in the data type designation step that has been registered in the voice pattern/ data registration step corresponding to the voice pattern retrieved in the ~~voice~~speech recognition step is called up.

Claim 32 (original): A machine-readable record medium as claimed in claim 31, wherein the various types of data at least includes a telephone number, a mail address and a URL (Uniform Resource Locator).

Claim 33 (original): A machine-readable record medium as claimed in claim 31, wherein the type of data to be called up is designated by the user in the data type designation step.

Claim 34 (original): A machine-readable record medium as claimed in claim 31, wherein the type of data to be called up is automatically designated based on application activation status of the mobile communications terminal in the data type designation step.

Claim 35 (currently amended): A machine-readable record medium as claimed in claim 31, wherein the ~~voice~~-speech recognition process further comprises a display step in which the data called up in the memory search step is displayed.

Claim 36 (currently amended): A machine-readable record medium as claimed in claim 31, wherein the ~~voice~~-speech recognition process further comprises a communication starting

AMENDMENT UNDER 37 C.F.R. § 1.111  
U.S. Application No. 10/015,881

step in which communication with the target designated by the user is automatically started by use of the data called up in the memory search step.
